

Remove the uncertainty from your SAP PI/PO migration

Discover your SAP PI/PO landscape, identify migration candidates, estimate migration effort and automate the move to SAP Integration Suite with one platform.

The hidden challenge of SAP PI/PO migration

Every organization asks the same questions before starting a migration.

- What do we actually have?
- Which interfaces are still used and which ones can be retired?
- What will the migration cost?
- Where do we begin?

The answers rarely exist in one place. Instead, organizations spend weeks documenting interfaces, analyzing dependencies and estimating migration effort before the first integration is even migrated.

Migration projects become expensive long before the first interface is migrated. Without complete visibility, planning is based on assumptions rather than facts.

One platform. Complete insight. Predictable migration.

Instead of manually analyzing hundreds or thousands of integrations, Figaf automatically discovers your SAP integration landscape, identifies migration candidates and provides the information needed to plan, prioritize and execute a successful migration.

The result is a migration project based on facts rather than assumptions, reducing project risk before the first interface is migrated.

Discover your landscape

Automatically build a complete picture of your SAP integration landscape.

- Interface inventory
- Usage analysis
- Dependencies
- Documentation

Build the migration plan

Know exactly what should migrate and what shouldn't.

- Migration candidates
- Complexity analysis
- Effort estimation
- Retirement candidates

Migrate with confidence

Automate repetitive migration tasks while keeping experts in control.

- Automated migration
- Guided corrections
- Validation
- Best-practice recommendations

Validate the outcome

Validate migrated integrations before production.

- Progress tracking
- Migration status
- Landscape overview
- Documentation

A successful migration starts with complete visibility.

Successful migration projects start with facts, not assumptions.

Once organizations understand their SAP integration landscape, they can prioritize the right interfaces, estimate effort more accurately and automate repetitive migration tasks.

- Unused integrations don't get migrated
- Complex interfaces can be planned properly
- Migration effort becomes easier to estimate
- Repetitive tasks can be automated

The result is a migration project that is faster, has lower risk and is easier to manage.

Reduce assessment time

≈ 80%*

Automatically discover and document the integration landscape instead of analyzing interfaces manually.

Accelerate migration

Weeks instead of months*

Automate repetitive migration tasks so experts can focus on the integrations that require their expertise.

Migrate with confidence

= Risk reduction

Identify unused interfaces, dependencies and potential issues before migration begins.

* Illustrative examples. Actual savings depend on your SAP landscape and the scope of your migration.

Building a predictable migration project

Without complete visibility	With Figaf
⌚ Nobody has a complete overview of the integration landscape.	✓ Automatic discovery creates a complete inventory of interfaces, dependencies and documentation.
⌚ Migration effort is difficult to estimate.	✓ Complexity analysis provides a realistic basis for planning and prioritization.
⌚ Unused integrations are migrated unnecessarily.	✓ Usage analysis identifies candidates for retirement before migration begins.
⌚ Migration relies on manual analysis and repetitive work.	✓ Automation accelerates migration while experts focus on the integrations that require their expertise.
⌚ Validation is time-consuming and inconsistent.	✓ Automated validation helps ensure migrated integrations behave as expected.

Migration is only the beginning

Once your integrations are running on SAP Integration Suite, they need to be developed, transported, documented and governed throughout their lifecycle.

That's why every Figaf Migration Tool subscription includes a trial version of Figaf DevOps, helping you establish a standardized SAP integration delivery process from day one.
