

Figaf DevOps Tool™ if you want happy customers

Upgrading or changing SAP Integration processes can have serious consequences if it fails. Figaf DevOps Tool tests and validates upgrades and changes of SAP PI/PO/ CPI before it is run. Thereby you can run an upgrade or change of a SAP Integration system with a minimal risk of failure - fully documented, much faster and more reliable. Figaf DevOps Tool is already tested and in use in large organizations.

Use Figaf DevOps Tool for testing and managing your SAP Integration system

Implement upgrades/changes without failure or breakdowns

Save money, time and reputation

How does Figaf DevOps Tool differ from the SAP PIT?

Figaf DevOps Tool tests if any failure will appear, before running an upgrade or change of SAP Integration. Hereafter it runs automated processes where some of the same processes are manual if using the SAP PIT.

Example from a client

Anadanco Petroleum ran a very fast upgrade with no mistakes in the making. Before running the upgrade it was tested, that the upgrade wouldn't cause problems to existing interfaces.

It gave a SAFETY when upgrading the SAP system.

About Figaf

Figaf is founded by SAP integration expert, Daniel Graversen who has for many years developed and tested tools for SAP processes. Figaf develops software for SAP Integration. The company is based in Denmark and works with large companies around the world.

By using Figaf DevOps Tool you can easily help your customers to a more effective and safe solution for their SAP Integration platform.

Figaf DevOps Tool is validated and tested and ready for use.

The customer will experience an effective upgrade, development or improvement without failure or downtime.

This tool saves you lots of time and resources for development and thereby helps your customers faster to get a good solution.

Figaf DevOps Tool - 3 in 1

Figaf DevOps Tool

Simplify your SAP Integration delivery

Figaf Testing Tool

Test your interfaces without coding

Figaf Alerting Tool

24/7 support. Knowledge sharing and automation

Figaf DevOps Tool improves your SAP PI/PO/CPI change management

We have automated the full process from start to end designed to optimize SAP PI/PO/CPI. This way you get the transport documented - inclusive all changes made. We want to help you spend less time and get a better documentation of the changes you make to your SAP integration system.

The reason why we have developed this tool is, that SAP PI/PO change management and documentation haven't developed much. Furthermore it is a manual process that requires that people are spending a lot of time on documentation.

This means that all your SAP PI/PO/CPI transports will be:

- Documented - inclusive all your developed objects
- Linked to a business reason (service request) so you know what has been changed and why
- Tested and validated in the QA system with same test cases to make sure everything works as expected
- Configured in one place so developers do not need access to configure production system
- Linked with the incident system so you can get information about what is wrong with your system faster

Because of the above, you will be able to:

- Deliver integrations faster because of an automated delivery process with less time consumption
- Get happier employees because they do not need to perform documentation manually
- Run a faster QA process because you have your documentation created automatically
- Deliver higher quality with fewer errors because you are able to test all integrations before they are run
- Limit direct modifications in productive systems because users will not need access

Help your customers feel safe with a tested and validated solution
